

FIDIC Claims Intelligence Suite — Executive Overview

InfraMind EPC | Strategic Product Overview | June 2026

Prepared by Samanta Nayak — Manager, Contracts & Claims | Infrastructure AI Architect

What This Is

The FIDIC Claims Intelligence Suite is a proposed product portfolio for improving notice discipline, event logging, claim structuring, and contractual correspondence on EPC projects. It brings together four connected product concepts shaped by direct contracts and claims experience in live project environments.

The suite is not presented as a fully deployed commercial platform. It is a practitioner-built roadmap for tools intended to reduce one of the most common causes of claim failure: weak process discipline between event occurrence and claim submission.

The Problem It Addresses

Claims are often lost long before they are argued. Deadlines are missed, records are not structured in time, event logs are assembled retrospectively, and claim narratives are drafted late under pressure.

The result is predictable:

- notices are inconsistent,
- entitlement support weakens,
- drafting takes too long,
- project teams lose control of chronology,
- disputes become harder to defend.

The suite is designed around the full claims preparation chain, not just one document at the end.

Product Modules

Module	Role in Workflow	Current Position
FIDIC Notice Monitor	Tracks notice obligations and escalation points	Product concept / MVP direction
EOT Event Log Compiler	Structures delay and event records for EOT support	Product concept

Module	Role in Workflow	Current Position
Claim Narrative Drafter	Builds structured first-draft claim narratives	Product concept
Letter Drafter EPC	Assists preparation of contractual letters and notices	Product concept

Why This Suite Matters

Most contract management systems store documents. They do not actively help a project team preserve entitlement. What matters in claims work is not only where the documents sit, but whether the right action happens at the right time.

This suite is intended to support four critical needs:

- deadline awareness,
- contemporaneous event structure,
- better narrative discipline,
- stronger correspondence quality.

Strategic Value

Value Area	Intended Benefit
Notice discipline	Reduce risk of missed contractual deadlines
Record quality	Improve contemporaneous event capture and traceability
Drafting speed	Shorten time from raw inputs to review-ready draft
Consistency	Standardise structure and drafting quality across teams
Claims readiness	Improve documentary preparation before disputes escalate

Personal Experience Behind the Suite

The ideas behind this suite come from direct project experience in contracts and claims management at Larsen & Toubro, particularly on MAHSR T-3 and earlier arbitration-linked work on OPGC MGR. Those projects shaped the underlying problem statements: notice discipline, delay linkage, record structure, and claim drafting pressure.

This background informs the product direction, but no current client deployment of the full suite is being claimed.

Where It Fits

The suite is best understood as part of InfraMind EPC's broader operational intelligence direction. It complements advisory work in contracts, claims, delay analysis, and project controls by focusing on the document and drafting layer where entitlement is often preserved or lost.

Who It Is For

- EPC contracts and claims teams
- project directors overseeing entitlement exposure
- delay analysts and planning teams supporting EOT claims
- legal counsel reviewing claim documentation
- owners, PMCs, and engineers seeking better process discipline around claims administration

Current Status

Status: Strategic product roadmap / concept-stage portfolio

The suite is available for presentation, discussion, and future pilot scoping. Any module-specific implementation should be positioned as planned, prototype, pilot, or concept stage unless separately evidenced.
