

Unifier Sync — Case Study

InfraMind EPC | Operational Automation Case Study | June 2026

Prepared by Samanta Nayak — Manager, Contracts & Claims | Infrastructure AI Architect

Case Study Summary

Unifier Sync is a practitioner-built automation developed around a real correspondence management bottleneck on the MAHSR T-3 project. The underlying problem was simple but high-impact: contractual correspondence had to be extracted from Oracle Primavera Unifier, renamed correctly, and filed into an organised archive through a repetitive manual process.

The automation was created to reduce manual effort, improve completeness, and strengthen the quality of the project record used for contract administration and claims support.

The Operational Problem

Before automation, the team spent hours each day downloading correspondence one record at a time, renaming files, and placing them into the right folder structure. This was not only slow; it also created risk.

The real exposure included:

- missed or delayed retrieval of correspondence,
- inconsistent archive structure,
- manual filing errors,
- slower evidence compilation during claims preparation.

What Was Built

Unifier Sync was developed as an automation bridge between the Unifier interface and a structured file archive. Its purpose was to replicate a repetitive manual workflow with more consistency and speed.

Key functional intent included:

- automated navigation through correspondence records,
- batch download of attachments,
- structured file naming,
- organised output hierarchy,
- completeness-focused extraction.

Measured Outcome on MAHSR T-3

The following results relate to Samanta Nayak's direct project experience on MAHSR T-3 and should be understood as project-specific operational outcomes rather than commercial product claims.

Measure	Result	Context
Time per batch	Reduced from 3–4 hours to about 15 minutes	MAHSR T-3 workflow
Improvement	Approx. 85–90% time reduction	MAHSR T-3 workflow
Archive quality	Structured and retrieval-friendly	Correspondence evidence management
Operational benefit	Faster access to claims-support records	Contract administration use case

Why It Matters

The significance of this case is not just productivity. It shows how targeted automation can improve record quality in areas that directly affect claims support and documentary discipline.

For contracts teams, the benefit is straightforward: less time spent on repetitive extraction and more time available for review, analysis, and action.

What This Demonstrates

- Useful automation in EPC environments can start from a very specific process bottleneck.
- The best solutions are often shaped by the practitioner doing the work.
- Small operational tools can materially improve the quality of contract records.
- Practical automation does not need to begin as a large enterprise implementation.

Positioning Note

This document presents a project-based operational case study linked to MAHSR T-3 experience. Any future commercialisation, packaging, or deployment of Unifier Sync should be positioned separately from this project-specific outcome.
